**Our next Sheep & Lamb Sale will be 23<sup>rd</sup> of June, 2022 commencing at 12.30pm**

*Did you know...*

- Of the five senses cattle possess, sight is the most dominant. Hearing and smell also play important roles in how cows assess their environment.
- As a prey species, cattle have an inherent fear of unfamiliar objects, situations, smells, sudden movements and noises. As well they can experience fearfulness in situations where they are solitary or isolated. Understanding this is critical to managing them in a low stress manner
- The behaviours of cows will change in response to the situations they are in and the handling they experience, resulting in an increased or decreased frequency of common behaviours.
- The behaviour of the cow handler has an enormous impact on cow behaviour, welfare and performance. Negative behaviours produce more fearful cows. Positive behaviour will lead to a relaxed herd of cows that are easier to handle
